

SOUTHERN SOUTH AUSTRALIA

SCALDING

Scalds are bare areas which occur where thin sandy to loamy topsoils have been eroded, exposing sub-surface material which seals over. This material is sometimes sodic and / or saline. Scalds are not associated with saline groundwater.

Classes are based on an interpretation of soil landscape map units which are classified according to the proportion of area affected by scalding.

Proportion of land affected by scalding

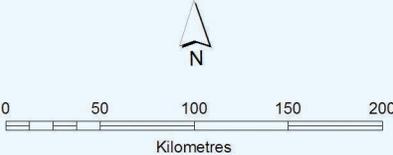

- Negligible
- Up to 5%
- 5 - 10%
- 10 - 50%
- More than 50%
- Not applicable

- NOTES ON USE OF THE MAP:
1. This information is derived from limited field inspection, and is subject to change without notice.
 2. Boundaries between mapping units should be treated as transition zones.
 3. The map is intended to provide a regional overview and should not be used to draw conclusions about conditions at specific locations.
 4. Under no circumstances must the scale of the map be enlarged beyond its scale of mapping.
 5. Advice from DEWNR Soil and Land Program should be sought prior to using this information for commercial decision making.
 6. Under no circumstances may the data or information associated with this map or any accompanying report be altered in any way without the express permission of DEWNR Soil and Land Program.
